M-Files®
Simply Easy Document Management

M-Files Reporting - A Visual Means to Analyzing Your Business Processes!

The majority of your business processes revolve around your enterprise content. These processes may be triggered by - or produce - requests, proposals, decisions and invoices, and information associated with your processes often accumulates in physical dossiers or network folders. It often remains unclear how well these processes are performing.

M-Files Reporting helps you analyze business processes by visualizing performance and asset relationships in graphical charts and dashboards. With M-Files Reporting, you have the power to gain greater insight into the average monthly acceptance rate of proposals, the processing time of service requests, the workload and skills profile of your staff and much more - all of which enables you to drive process improvements and make better decisions.

M-Files Reporting

- Improve decision making by visualizing and analyzing important properties associated with your enterprise content and the role they play in your business processes

- Create reports that combine data from your M-Files document vault with data from other business systems

- View reports embedded in the standard M-Files Client Interface. Print and export reports to commonly used formats

## Charts and Dashboards Seamlessly Integrated Within Windows Explorer

M-Files Reporting publishes reports and dashboards directly inside the standard M-Files client interface, where they can be embedded within any view in M-Files. Users can apply filters by selecting virtual folders or objects inside the view, and reports are easy to print or export to commonly used file formats such as Microsoft Word, Excel or PDF. In addition, report access and visibility can be controlled by leveraging M-Files metadata-driven permissions management capabilities.

Complement Reporting with Data from 3rd Party Systems

M-Files is an excellent tool for publishing information to a larger audience within your organization, as well as to external users. With M-Files Reporting, you can produce business intelligence analyses by designing reports and dashboards that take data from the M-Files repository as well as from your other IT systems - such as your ERP, CRM, or accounting and billing systems. Process-related performance information can be easily combined with process outcomes recorded in your business systems. For example, you can analyze outstanding proposals issued by your sales staff combined with their sales revenue figures recorded in your CRM system in order to glean greater insight into the effectiveness of your sales team's activities and processes.

Framework Based on Microsoft SQL Server Reporting Services

M-Files Reporting is based on the proven Microsoft SQL Server Reporting Services framework, enabling the authoring of reports using the popular Microsoft SQL Server Report Builder or Microsoft SQL Server Business Intelligence Development Studio.

Obtain insight into the performance profile of your business processes and assets with the rich visualization and analytical capabilities in M-Files Reporting
