

# Windows and iPhone Just Had a Baby!

## Prepare to Work Smarter

Anyone who has used their iPhone or iPod for playing music knows how easy it is to browse and organize music files by genre, album, year and artist. Can you imagine the hassle it would be if you would have to find and store your songs by browsing through **folders** on your phone?

So why tolerate it when working with business files?

**Wouldn't it be great if Windows allowed you to do with business documents and information what an iPhone does with music?**

- Instantly find any document, no matter who stored it
- Organize documents on the fly, in a manner that makes sense to you
- See what supplier, project, agreement etc. are related to a document, like a purchase invoice

[M-Files](#) provides a new, fresh-thinking approach to storing, accessing and managing your business documents and information. It provides the freedom, speed and easy of use of an iPhone, yet it's so tightly integrated in Windows that it just feels as if it's part of it!

Thousands of organizations worldwide have already joined the M-Files revolution and their staff reap the benefits of working smarter every single day. This includes companies of [any size and from every industry](#) like Pandora, SAS Institute, EADS, Elekta, Tozzi and Microbiologics:

No more endless browsing through folders, no more having to ask a colleague where she stored a document, never a document lost or accidentally overwritten, and always access the right document instantly from any location or device.

Doesn't that sound like something you would like your business to benefit from too?
